Mathers 59 "Practical Programming Methods for the Development and Use of Software" by Martin Fowler, John F. Stokes &

Robert F. Mathers Computer World Computer History and Technology 60 From the early twentieth century to the early twenty-first century, the concept of "program" (or "programming") is an important part of computing. A computer program serves as a system-wide representation of a particular information, while hardware or software, such as a microprocessor or disk drive, is used to do much more complicated tasks. As programming was rapidly adopted by organizations on this planet, it became increasingly difficult to differentiate its function to each organization and to the computer's native, built-in language. A software-defined standard was proposed by Intel Corporation, a company known for its highly efficient processors that became widely adopted in the computer industry. It was named the COM 2200, the precursor to the more widely utilized COM API. Computer programming became a "field of academic study", and in the 1970's and '80's the study of programming was revived. Despite efforts to preserve the original spirit of computer programming by combining it with the mathematical methods of algebra and finite element analysis, the research continues. Computer Science Computer Science is an interdisciplinary discipline concerned with problem solving, computational science, computer graphics and computer architecture, and computer programming. Computer Science is broadly divided into four areas of interest: computer hardware and software, computer systems, programming languages and applications, and computing architectures. As with the humanities, research in computer science has come to dominate both mainstream universities and non-academic organizations. For this reason, most computer science departments focus on the development of programming languages to help students learn how to design software applications, and on problem solving and problem-solving tools for working with computers. Many universities, while still concerned primarily with their academic programs, have also developed computer science programs in the past. An example of this is the School of Information and Communication Sciences at the University of California Irvine, a program that offers courses at both the undergraduate and graduate levels. Programs for introductory computer science courses in many university departments include, for instance, "Implementing Software", "Data Science Programming", and "Programming with JavaScript and Python". There are also courses in computer engineering where student are given an introduction to the theoretical understanding of the engineering problem-solving tools such as a programming language - 9.00.2018 - 11.30.2007.. .3.2015 [11, 7, 25] [13] [8] [20] [15] [3] [17] [20] [29] [6] [7] [20] [15] [26]..
